Unfortunately, industry-leading packages like Adobe Premiere, After Effects, and Apple's Final Cut Pro are not cheap. Fortunately, there is a selection of free video editing apps that are likely for Mac to sink your teeth into. Some are made for beginners, while others will meet thick video editors with their impressive feature sets. These are our favorite free video downloader for Mac. 1. iMovie Summary: Free, consumer-level video editing. It is well optimized for Apple hardware and is suitable for most individual projects. iMovie is free for anyone who owns a Mac. In addition, the iOS version is completely free for all iPhone and iPad owners. Part this is aimed at consumers who want to quickly create videos with footage stored in their Photos library. To facilitate this, iMovie uses a simple timeline player that doesn't allow multiple tracks to be edited. Despite linear editing and a basic user interface, iMovie is a the software can process 4K videos and match the green screen. It also supports images in video images and slow motion/fast transition image effects. iMovie can create headlines, drag-and-drop transitions, and motion graphics like 3D globes and travel maps. The app comes with built-in music and sound effects ready to go. It can create Hollywood-style trailers using the footage you provide. In addition, the app allows you to export directly to YouTube and Vimeo with resolutions up to 4K. Download: iMovie (Free) 2. DaVinci Resolve Summary: A powerful, professional video downloader that lacks the color classification tools that famous developers. The Studio version of DaVinci Resolve costs nearly \$1,000, but the basic version is free. Better still, it includes the same high-quality image processing capabilities as the more expensive version. You get a powerful video player, some of the best color editing capabilities around, and even support for external hardware tables to enable faster editing. There are limitations, of course. The main one is resolve that can only be exported in SD, HD and Ultra HD, which is likely to be more than enough for most users. In addition, the app sets limits on a number of advanced classification and tracking tools. However, these restrictions are primarily in place to persuade professional users to upgrade. The app may have a decent learning curve, but DaVinci Resolve is one of the most powerful video editing sets on the planet and you get a lot for free. See our comparison of DaVinci Resolve and HitFilm Express for more on how it stacks. Download: Da Vinci Resolve (Free) 3. OpenShot Summary: Free and open source video player with an impressive list of features. However, the interface is outdated and may cause some users to shut down. OpenShot is a multi-platform open source tool that has been available since 2008. It was built with the aim of providing a stable, free and accessible video player. The project receives several major updates each year, in line with expectations for an open source project with a small team. OpenShot's feature list has evolved over the years to include excellent support for a variety of formats, key frames for animation and unlimited video/audio tracks. It's also packed during the transition and supports compositing, title, and a heap of extras that you'd expect from a modern video editor. Critics in the past have criticized the reliability of OpenShot, but it's still worth shooting for free. Download: OpenShot (Free) We also recommend this video editing for children. 4. Shotcut Summary: An open source editor capable of an interface superior to OpenShot. Here's another free, open source, multi-platform video player. Calculated list Shotcut's is just as impressive as OpenShot, but shotcut has a great interface. It's more like a pro-tier app than a free app. The app supports a wide range of files and video formats, including 4K, ProRes and DNxHD. Shotcut also includes great support for working audio, an impressive list of video effects (including compositing and transitions), and a flexible user interface. It is noteworthy to support advanced features such as 5.1 surround sound, three-dimensional color editing, and a large number of video and audio filters. There's even an official Set of Shotcut video tutorials that you can watch to help you speed up with the downloader. Download: Shotcut (Free) 5. Blender summary: Not a purpose-built video player, but it's a powerful free tool. Blender is a free 3D model and mixing application used in some high-end products. However, many people don't realize Blender is also a capable non-linear video player, as long as you're willing to take the time to learn. You can use blender to cut and stitch video, mix and synchronize audio or apply adjustment layers, transitions, and filters. You probably won't edit the whole movie together in blender, but for basic editing tasks, it may be enough. The blender is not the easiest system to learn, but underneath the hood is a powerful non-linear video player. Check out Daniel Pocock's quick guide to video editing in Blender and the official Blender video order guide to learn more. Download: Blender (Free) 6. Lightworks Summary: A powerful editor with many features, but some severely limited input options make the free version feel like a trial. Lightworks is one of the most powerful apps on this list. I happily recommend it on all other plans if it's not too restricting to free users. The free version includes video effects, multicam and titling editing, as well as the usual multilayered timeline approach you'd expect from a comprehensive downloader. Unfortunately, the display (exporting your project) is limited to 1080p on Vimeo and 720p on YouTube. You can also show up for Lightworks Archives, but you lose the option to export H.264, MP4 or even DVD. So while the tool set is vast, Lightworks isn't a very attractive free edit unless you want to try it out for free and upgrade later. Download: Lightworks (Free, premium version available) 7. Avidemux Summary: A capable freebie, but lacking polish and features. Avidemux has made a list of our best Linux video downloader. Although it is basic in nature, it works well for simple editing tasks. The app supports multiple input and output formats. The project undergoes several updates a year, with development continuing at a steady pace. Thankfully, the team maintains parity in all three major versions, so you won't miss out on any features if you choose the Mac plan. Such as trim the video down to size, apply a video or audio filter, and switch code. If you're willing to dig a little deeper, you'll find a highly capable script editor to automodel many of these common tasks. Be sure to check out the Avidemux wiki for learning materials, and the Avidemux forum can help in case you get stuck. Download: Avidemux (Free) Mac Video Editing on a Budget So, is the best video player for you? iMovie is probably the best all-rounder. It's free, easy to use, and carefully optimized for Apple hardware. There are many features in it to meet beginners and intermediate users. However, it lacks the raw power to compete with Final Cut (check out the Final Cut Pro X shortcuts) or Premiere Pro. Da Vinci Resolve, on the other, is surprisingly rich feature. It offers multiple track editing and a large number of professional features to play with. The blender is open source and powerful, but bogged down by complexity. Shotcut and OpenShot are pretty even, so why not test drive them both? And if you're looking for something specific to edit 4K videos, check out VideoProc.
